Task 1: Deploy the Kubernetes Dashboard.....	24
Task 2: Access the Kubernetes Dashboard.....	24
Exercise 3 : Install and Configure Helm.....	25
Task 1: Install Helm on Workstation.....	25
Task 2: Create Service account and Cluster Role for Helm.....	26
Task 3: Initialize Helm.....	26
Task 4: Add SUSE Charts to Helm.....	27
Task 5: Install Centralize Logging.....	28
<b>Section 3 : Deploying a Workload.....</b>	<b>28</b>
Exercise 1 : Deploy a Simple Pod on Kubernetes.....	28
Task 1: View a Manifest for the Deployment.....	28
Task 2: Deploy a simple application (GUI option).....	30
Task 3: Deploy a simple application (Command Line option).....	32
Exercise 2 : Delete a Deployment on Kubernetes.....	33
Task 1: Delete the Deployment (GUI Option).....	33
Task 2: Delete the Deployment (Command Line option).....	34
Exercise 3 : Scale Out a Deployment.....	35
Task 1: View the Manifest for the Deployment.....	35
Task 2: Scale the Deployment (GUI option).....	35
Task 3: Scale the Deployment (Command Line Option).....	38
<b>Section 4 : Working With Kubernetes.....</b>	<b>39</b>

Exercise 1 : Update a Deployment.....	39
Task 1: Create a New Manifest for the Deployment.....	39
Task 2: Update the Deployment.....	40
Exercise 2 : Update a Deployment Via Rolling Updates.....	41
Task 1: Create a New Manifest for the Deployment.....	41
Task 2: Update the Deployment.....	42
Exercise 3 : Expose a Service Running in a Pod.....	42
Task 1: Create a Manifest for the Service.....	43
Task 2: Define the Service.....	43
Task 3: Access the Exposed Service.....	43
Exercise 4 : Setup Readiness and Liveness Probes.....	44
Task 1: View manifest for the Deployment.....	44
Task 2: Deploy Manifest.....	46
Task 3: View the Replica sets.....	46
Task 4: Kill an nginx server.....	46
Exercise 5 : Define Limits for Containers and Pods in Kubernetes.....	47
Task 1: Create a New Namespace in the Cluster.....	48
Task 2: Create a Manifest for the Limits.....	48
Task 3: Apply the Limits to the Namespace.....	48
Exercise 6 : Introduction to Helm.....	49
Task 1: Use Some Basic Helm Commands.....	49
Exercise 7 : Deploy an Application with Helm.....	50
Task 1: Create Helm Chart Config File.....	50
Task 2: Deploy the Helm Chart.....	51
Task 3: Access the Application Deployed by the Helm Chart.....	51
Task 4: Update the Application Release.....	52
Task 5: Delete a Deployed Helm Chart Release.....	53

## **Section 5 : Storage.....**

Exercise 1 : Configure NFS Persistent Storage.....	54
Task 1: Create the Persistent Volume on the NFS Server.....	54
Task 2: Create the Manifest for the Persistent Volume.....	54
Task 3: Create the Manifest for the Persistent Volume Claim.....	54
Task 4: Create the Manifest for the Busybox Instance.....	55
Task 5: Create the Manifests for the Web Frontend.....	55
Task 6: Deploy the Objects.....	56
Task 7: Test the Persistent Data.....	57
Task 8: Remove the Objects from the Cluster.....	58
Exercise 2 : Configure Persistent Storage with a NFS StorageClass.....	59
Task 1: Create the Directory for the Persistent Volumes on the NFS Server.....	59
Task 2: Define a Service Account, Cluster Role and Cluster Role Binding.....	59
Task 3: Define a Storage Class.....	61
Task 4: Create a Persistent Volume Claim and Pod that Uses It.....	62
Task 5: Create a Persistent Volume Claim and Pod that Uses It.....	64
Task 6: Remove the Objects from the Cluster.....	65
<b>Section 6 : Deploying Advanced Workload.....</b>	<b>66</b>
Exercise 1 : Run Heimdall as a standalone container.....	66

<b>SUSE U Advanced - SUSE CaaS Platform</b>	
Task 1: Create a place for Heimdall to store it's files.....	66
Task 2: Run Heimdall as a container.....	66
Task 3:On the Workstation launch the Chrome Browser.....	67
Task 4: Create an App in Helm.....	68
Task 5: Stop and restart container.....	69
Task 6: Verify with Browser.....	69
Task 7: Stop Container Instance.....	69
Task 8: Try and run multiple versions of Heimdall.....	69
<b>Exercise 2 : Launch Heimdall.....</b>	<b>70</b>
Task 1: Create the Manifest for the Persistent Volume.....	70
Task 2: Deploy Heimdall.....	71
Task 3: View the Deployment.....	72
Task 4: View Heimdall in a Browser.....	74
Task 4: Re-deploy Heimdall.....	74
<b>Exercise 3 : Configure Heimdall to use NFS Persistent Storage.....</b>	<b>74</b>
Task 1: Create the Manifest for the Persistent Volume.....	74
Task 2: Create the Manifest for the Persistent Volume Claim.....	75
Task 3: Create the Manifest for the Service so we can access the deployment.....	75
Task 4: Create the Manifests for the Web Frontend.....	76
Task 5: Deploy the Objects.....	77
Task 6: Test the Persistent Data.....	78
Task 7: Remove the Objects from the Cluster.....	78

## Documentation Conventions:

---

The following typographical conventions are used in this manual:

<b>Bold</b>	Represents things you should pay attention to or buttons you click, text or options that you should click/select/type in a GUI.
<b>Bold Gray</b>	Represents the name of a Task or in the context of what is seen on the screen, the screen name, a tab name, column name, field name, etc.
<b>Bold Red</b>	Represents warnings or very important information.
<b>Option &gt; Option &gt; Option</b>	Represents a chain of items selected from a menu.
<b><i>BOLD_UPPERCASE_ITALIC</i></b>	Represents an “exercise variable” that you replace with another value.
<b>bold monospace</b>	Represents text displayed in a terminal or entered in a file.
<b>bold monospace blue</b>	Represents commands entered at the command line.
<b>bold monospace green</b>	Represents a file name.

SUSE U Advanced - SUSE CaaS Platform

SUSE U Advanced - SUSE CaaS Platform

# 1 Demonstration of SUSE CaaS Platform

---

## Description:

How to highlight the Key Benefits of SUSE CaaS Platform

**(No Exercises)**

## 1- 1 Start the Lab VMs

### Description:

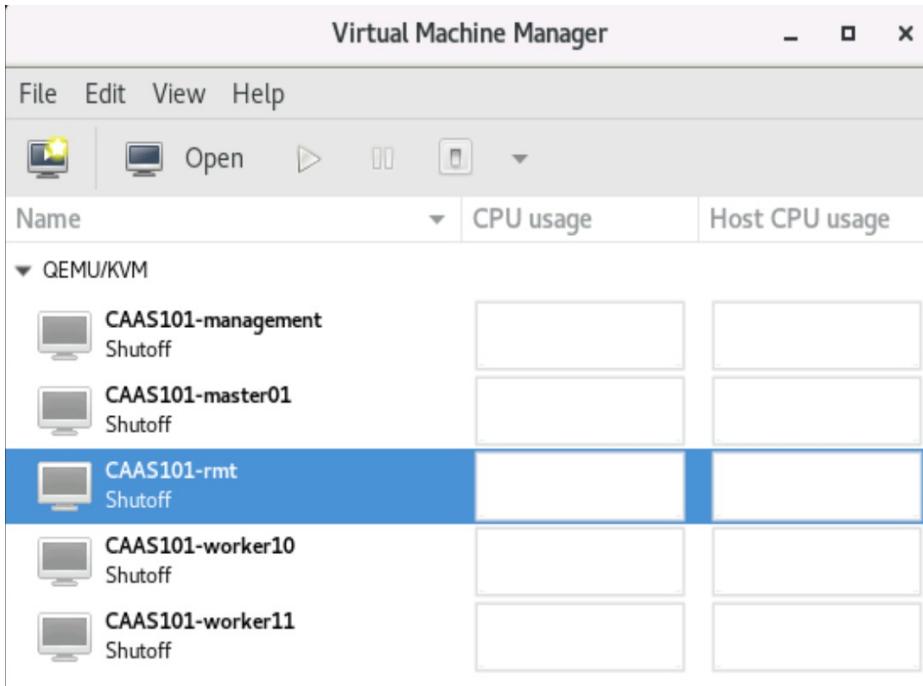

In this exercise, you use the Virt-Manager utility to start the lab VM(s) in the proper order.

### Task 1: Start the Lab VMs

1. On the VM host, launch the Virt-Manager utility  
(4<sup>th</sup> icon from the left on the dock at the bottom of the screen)  
You should see the course VMs listed.

2. Right-click on the **CAAS101-rmt** VM and select **Run**

3. Double-click on the **CAAS101-rmt** VM to view its console

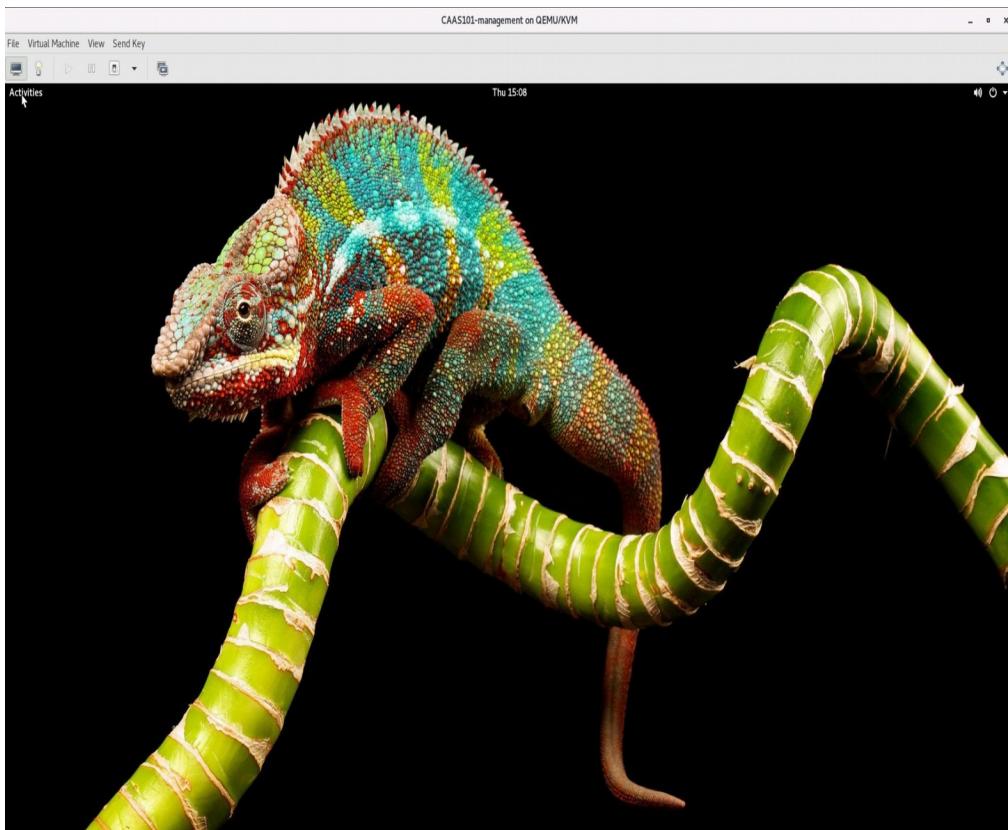

When the **CAAS101-rmt** VM has finished booting completely, close its console window.  
(You can use the CPU utilization graph in Virt-Manager to see when the node is finished booting and starting services).

4. Power on the reset of the Virtual Machines **CAAS101-management**, **CAAS101-master**, **CAAS101-worker10** and **CAAS101-worker10**

\*note you can power all of the on at the same time

When the **Workstation** has finished booting you will use it as your management workstation for all tasks including managing VMs with the Virt-Manager utility.

5. Make sure you double click on the **CAAS101-management** so you view it full screen
6. Open a Terminal session by clicking on the 3<sup>rd</sup> icon down

---

### **Summary:**

In this exercise, you started the required lab VM(s) in the proper order.

(End of Exercise)

## 1- 2 Prepare the Management Workstation

---

### Description:

In this exercise, you install prepare the Management Workstation so it has all of the software needed to start the CaaS Platform installation.

### Dependencies:

The RMT server must be configured (Optional Docker Registry)

DHCP, PXE and DNS must be configured.

---

### Task 1: Install needed software on Management Workstation

1. On the **Workstation**, open a terminal
2. Enter the following command to install skuba and the kubernetes client

**sudo zypper in skuba kubernetes-client**

I will tell you the amount of additional drive space needed and it will prompt you to press **y** to continue

3. Press the '**Y**' key to continue

when it finished you should see a screen similar to the image below

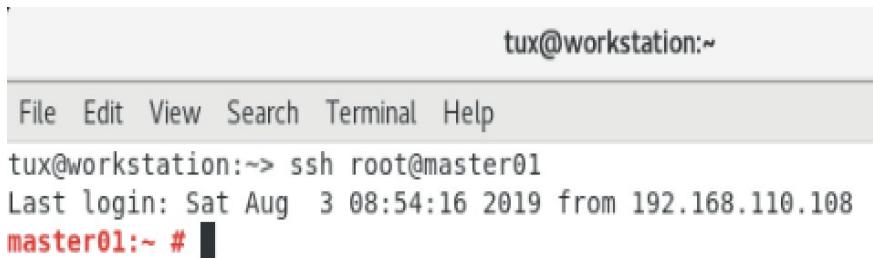

tux@workstation:~

```
File Edit View Search Terminal Help
Retrieving: kubernetes-common-1.15.0-2.4.1.x86_64.rpm ..... [done]

(5/5) Installing: kubectl-caasp-0.8.1-2.10.2.x86_64 ..... [done]
tux@workstation:~> |
```

## Task 2: Test to ensure SSH keys are properly set

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to test your **ssh keys** to master01  
**ssh root@master01**
3. You should see a red prompt that says master01

A screenshot of a terminal window. The title bar says "tux@workstation:~". The menu bar includes "File", "Edit", "View", "Search", "Terminal", and "Help". The main area shows the command "ssh root@master01" being entered, followed by the output: "Last login: Sat Aug 3 08:54:16 2019 from 192.168.110.108" and the prompt "master01:~ #".

4. Notice that you did not need to type in a password or accept a key?  
This is because of the pre-work done on the workstation
5. Exit your ssh session from the terminal prompt  
**exit**
6. Repeat the step 2 and 3 for **worker10** and **worker11**

---

### **Summary:**

In this exercise, you installed Skuba and the Kubernetes Client Utilities. You also tested that the SSH keys were set up properly and you could seamlessly connect to all of the nodes.

(End of Exercise)

---

## **1- 3 Setup SSH Keys**

---

### **Description:**

In this exercise, you install setup all of the machines so you can ssh to any of the nodes with a username or password

---

### **Task 1: Load ssh-agent**

1. On the **Workstation**, open a terminal
2. Enter the following command to Start the ssh-agent  
**eval "\$(ssh-agent -s)"**
3. Enter the following command to create an ssh key  
**ssh-keygen**  
When it asks you questions just take the default

### **Task 2: Run ssh-keygen on all nodes**

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to test your **ssh keys** to master01  
**ssh root@master01**  
password is **linux**
3. You should see a red prompt that says master01

tux@workstation:~

```
File Edit View Search Terminal Help  
tux@workstation:~> ssh root@master01  
Last login: Sat Aug  3 08:54:16 2019 from 192.168.110.108  
master01:~ #
```

4. Enter the following command in the terminal to create an **ssh key**  
**ssh-keygen**
5. Exit your ssh session from the terminal prompt  
**exit**
6. Repeat the step 2 and 3 for **worker10** and **worker11**

### Task 3: Copy SSH keys to Management workstation

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to test your **ssh keys** to master01  
**ssh-copy-id -i ~/.ssh/id\_rsa.pub root@master**
3. Repeat the step 2 and 3 for **worker10** and **worker11**

### Task 4: Test to ensure SSH keys are properly set

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to test your **ssh keys** to master01  
**ssh root@master01**
3. You should see a red prompt that says master01

```
tux@workstation:~  
File Edit View Search Terminal Help  
tux@workstation:~> ssh root@master01  
Last login: Sat Aug  3 08:54:16 2019 from 192.168.110.108  
master01:~ #
```

4. Notice that you did not need to type in a password or accept a key?  
This is because of the pre-work done on the workstation
5. Exit your ssh session from the terminal prompt

[exit](#)

6. Repeat the step 2 and 3 for **worker10** and **worker11**

---

### **Summary:**

In this exercise, you set it up so that you can ssh from the Management Workstation to any of the nodes without asking for a username or a password

(End of Exercise)

---

## **1 - 4 Install a CaaS Platform Nodes**

---

### **Description:**

In this exercise, you install a SUSE CaaS Platform all nodes.

### **Dependencies:**

The RMT server must be configured (Optional Docker Registry)

DHCP, PXE and DNS must be configured.

Master, and 2 worker nodes with SLES 15 SP1 installed and CaaS Platform Repos added

---

### **Task 1: Deploy the first Kubernetes Master node**

1. On the **Workstation**, open a terminal
2. Enter the following command create the basic config to our **kubernetes cluster**

**skuba cluster init --control-plane master.example.com my-cluster**

```
tux@workstation:~> skuba cluster init --control-plane master.example.com my-cluster
** This is a BETA release and NOT intended for production usage. **
[init] configuration files written to /home/tux/my-cluster
tux@workstation:~> █
```

3. Enter the following command to change into the newly created folder

**cd my-cluster**

4. Look at the cluster config filename **my-cluster**

**less kubeadm-init.conf**

```
tux@workstation:~/my-cluster> cat kubeadm-init.conf
apiVersion: kubeadm.k8s.io/v1beta1
kind: InitConfiguration
bootstrapTokens: []
localAPIEndpoint:
  advertiseAddress: ""
---
apiVersion: kubeadm.k8s.io/v1beta1
kind: ClusterConfiguration
apiServer:
  certSANs:
    - master.example.com
extraArgs:
  oidc-issuer-url: https://master.example.com:32000
  oidc-client-id: oidc
  oidc-ca-file: /etc/kubernetes/pki/ca.crt
  oidc-username-claim: email
  oidc-groups-claim: groups
clusterName: my-cluster
controlPlaneEndpoint: master.example.com:6443
dns:
  imageRepository: registry.suse.com/caasp/v4
  imageTag: 1.3.1
  type: CoreDNS
etcd:
  local:
    imageRepository: registry.suse.com/caasp/v4
    imageTag: 3.3.11
imageRepository: registry.suse.com/caasp/v4
kubernetesVersion: 1.15.0
networking:
  podSubnet: 10.244.0.0/16
  serviceSubnet: 10.96.0.0/12
useHyperKubeImage: true
tux@workstation:~/my-cluster> █
```

5. Install, configure and bootstrap the cluster-info

**skuba node bootstrap --target master.example.com master01**

```
tux@workstation:~/my-cluster> skuba node bootstrap --target master.example.com master01
** This is a BETA release and NOT intended for production usage. **
W0808 17:13:25.590213    2588 ssh.go:306]
The authenticity of host '192.168.110.7:22' can't be established.
ECDSA key fingerprint is 54:3e:9b:2e:21:fc:5c:70:ff:c4:99:7c:fa:b4:08:d0.
I0808 17:13:25.590316    2588 ssh.go:307] accepting SSH key for "master.example.com:22"
I0808 17:13:25.590327    2588 ssh.go:308] adding fingerprint for "master.example.com:22" to "known_hosts"
[bootstrap] updating init configuration with target information
[bootstrap] writing init configuration for node
[bootstrap] applying init configuration to node
[bootstrap] downloading secrets from bootstrapped node "master.example.com"
[bootstrap] successfully bootstrapped node "master.example.com" with Kubernetes: "1.15.0"
tux@workstation:~/my-cluster> █
```

## Task 2: Deploy the Worker nodes

1. add a **worker10** node to the cluster

**skuba node join --role worker --target worker10.example.com worker10**

```
tux@workstation:~/my-cluster> skuba node join --role worker --target worker10.example.com worker10
** This is a BETA release and NOT intended for production usage. **
W0808 17:23:50.580677    2632 ssh.go:306]
The authenticity of host '192.168.110.10:22' can't be established.
ECDSA key fingerprint is 19:7c:db:38:d2:c5:34:f6:cb:90:21:4e:1a:b5:5e:d7.
I0808 17:23:50.580863    2632 ssh.go:307] accepting SSH key for "worker10.example.com:22"
I0808 17:23:50.580916    2632 ssh.go:308] adding fingerprint for "worker10.example.com:22" to "known_hosts"
[join] applying states to new node
[join] node successfully joined the cluster
tux@workstation:~/my-cluster> █
```

2. add a **worker11** node to the cluster

**skuba node join --role worker --target worker11.example.com worker11**

You should see a message very similar to the message you received in the previous step.

3. Verify Cluster Status

**skuba cluster status**

```
tux@workstation:~/my-cluster> skuba cluster status
** This is a BETA release and NOT intended for production usage. **
NAME          OS-IMAGE           KERNEL-VERSION      KUBELET-VERSION   CONTAINER-RUNTIME   HAS-UPDATES   HAS-DISRUPTIVE-UPDATES

worker10      SUSE Linux Enterprise Server 15 SP1  4.12.14-197.10-default  v1.15.0        cri-o://1.15.0    <none>       <none>
worker11      SUSE Linux Enterprise Server 15 SP1  4.12.14-197.10-default  v1.15.0        cri-o://1.15.0    <none>       <none>
tux@workstation:~/my-cluster> █
```

---

### Summary:

In this exercise, you installed Skuba and the Kubernetes Client Utilities. You also tested that the SSH keys were set up properly and you could seamlessly connect to all of the nodes.

(End of Exercise)

---

## 2 Connecting to the Cluster

### Description:

In this section you will learn how to connect to the Cluster via both the command line and a GUI interface.

## 2- 1 Use the kubectl Command to Display Info About the Cluster

---

### Description:

In this exercise, you use the **kubectl** command to display info about the Kubernetes cluster.

---

### Task 1: Configure workstation for kubectl command

1. **On the Workstation, open a terminal**
2. Create official folder for kubernetes config filename  
**mkdir ~/.kube**
3. **On the Workstation, open a terminal**
4. Create config file

**cp ~/my-cluster/admin.conf ~/.kube/config**

### Task 2: Use the kubectl Command

1. From a terminal, enter the following command to view the URL of the Kubernetes master:

**kubectl cluster-info**

You should see the URL of the Kubernetes master displayed.

2. Enter the following command to see a more detailed output of the status of the cluster:

**kubectl cluster-info dump**

You should see a json dump of the status of cluster.

3. Enter the following command to display a list of Kubernetes nodes:

**kubectl get nodes**

You should see the list of nodes, their node names, status, age and version displayed.

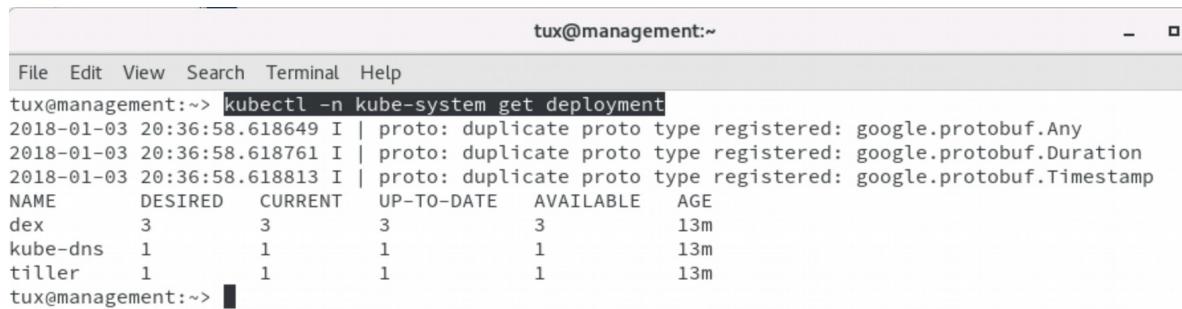

## SUSE U Advanced - SUSE CaaS Platform

```
tux@management:~/course_files/CAAS101/scripts> kubectl get nodes
2018-08-08 10:02:50.924418 I | proto: duplicate proto type registered: google.protobuf.Any
2018-08-08 10:02:50.924462 I | proto: duplicate proto type registered: google.protobuf.Duration
2018-08-08 10:02:50.924473 I | proto: duplicate proto type registered: google.protobuf.Timestamp
NAME      STATUS     AGE      VERSION
master01   Ready      1d      v1.9.8
master02   Ready      1d      v1.9.8
master03   Ready      1d      v1.9.8
worker10   Ready      1d      v1.9.8
worker11   Ready      1d      v1.9.8
worker12   Ready      1d      v1.9.8
tux@management:~/course_files/CAAS101/scripts> █
```

4. Enter the following command to display a list of Kubernetes nodes:

### **kubectl -n kube-system get deployments**

You should see the list of deployments, their nodes names, status, age and version displayed.

The screenshot shows a terminal window with the title "tux@management:~". The menu bar includes File, Edit, View, Search, Terminal, and Help. The command "kubectl -n kube-system get deployment" is entered, followed by its execution output. The output shows three deployments: dex, kube-dns, and tiller, each with 3 desired and current pods, up-to-date, and available. All three have an age of 13m.

```
tux@management:~> kubectl -n kube-system get deployment
2018-01-03 20:36:58.618649 I | proto: duplicate proto type registered: google.protobuf.Any
2018-01-03 20:36:58.618761 I | proto: duplicate proto type registered: google.protobuf.Duration
2018-01-03 20:36:58.618813 I | proto: duplicate proto type registered: google.protobuf.Timestamp
NAME      DESIRED   CURRENT   UP-TO-DATE   AVAILABLE   AGE
dex       3          3          3           3           13m
kube-dns  1          1          1           1           13m
tiller    1          1          1           1           13m
tux@management:~> █
```

5. Enter the following command to display a list of Kubernetes pods:

### **kubectl -n kube-system get pods**

You should see the list of pods, their names, status, and age displayed.

```
tux@management:~$ kubectl -n kube-system get pods

tux@management:~$
```

---

### **Summary:**

In this exercise, you downloaded the kubectl config file from the cluster and then ran some kubectl commands to view information about the cluster.

(End of Exercise)

---

## **2- 2 Deploy the Kubernetes Dashboard**

---

### **Description:**

In this exercise, you deploy the Kubernetes Dashboard.

We will also apply an RBAC configuration that turns off token based authentication and stops the dashboard from timing out after 10 mins.

---

## Task 1: Deploy the Kubernetes Dashboard

1. On the Workstation, open a terminal
2. Enter the following command to deploy the Kubernetes Dashboard:

**kubectl apply -f ~/STW-CaaSPv4/manifests/dashboard**

You should see that a `secret`, `serviceaccount`, `role`, `rolebinding`, `deployment` and `service` were created:

3. Enter the following command to view the pods deployed in the `kube-system` namespace:

**kubectl -n kube-system get pods**

You should see the `kubernetes-dashboard` listed among the pods.

4. Enter the following command to view the deployments in the `kube-system` namespace:

**kubectl -n kube-system get deployments**

You should see the `kubernetes-dashboard` listed among the deployments.

5. Enter the following command to view the services in the `kube-system` namespace:

**kubectl -n kube-system get services**

You should see the `kubernetes-dashboard` listed among the services.

## Task 2: Access the Kubernetes Dashboard

1. Enter the following command to start a kubectl proxy in a screen session:

**screen kubectl proxy**

You should see the proxy session started. Notice that port 8001 on the local host is the port used.

2. Enter the following keystrokes to detach from the screen session:

**ctrl+a ctrl+d**

You should be detached from the screen session and back at a command prompt.

3. Open a web browser and point to:

**http://localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy#!/login**

You should see the Kubernetes Dashboard authentication method screen.

4. Click: **Skip** to login without a token

Kubernetes Dashboard

Kubeconfig  
Please select the kubeconfig file that you have created to configure access to the cluster. To find out more about how to configure and use kubeconfig file, please refer to the [Configure Access to Multiple Clusters](#) section.

Token  
Every Service Account has a Secret with valid Bearer Token that can be used to log in to Dashboard. To find out more about how to configure and use Bearer Tokens, please refer to the [Authentication](#) section.

Choose kubeconfig file

SIGN IN    SKIP

5. From the list on the left, in the **Namespace** section, from the drop-down list (which is probably displaying the **default** namespace), select **kube-system**  
You should see the kubernetes dashboard deployment in the **kube-system** namespace.
6. From that same drop-down menu, select **default**  
You should see that there is nothing deployed in the **default** namespace.

---

### Summary:

In this exercise, you deployed the Kubernetes Dashboard to the cluster. You then started a kubectl proxy in a screen session and accessed the Kubernetes Dashboard.

(End of Exercise)

## 2- 3 Install and Configure Helm

---

### Description:

In this exercise, you install Helm and config it to pull charts from SUSE.

---

### Task 1: Install Helm on Workstation

1. On the **Workstation**, open a terminal
2. Enter the following command to install skuba and the kubernetes client

**[sudo zypper in helm](#)**

I will tell you the amount of additional drive space needed and it will prompt you to press

y to continue

## Task 2: Create Service account and Cluster Role for Helm

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to create a service account for Helm to use  
**kubectl create serviceaccount --namespace kube-system tiller**

3. Enter the following command in the terminal to create a cluster role for Helm to use

**kubectl create clusterrolebinding tiller --clusterrole=cluster-admin --serviceaccount=kube-system:tiller**

## Task 3: Initialize Helm

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to create a service account for Helm to use  
**helm init --tiller-image registry.suse.com/caasp/v4/helm-tiller:2.8.2 --service-account tiller**

3. Look to see if tiller is currently running (give it a minute if it is not in the **Ready** state)

### **kubectl get pods –all-namespaces**

```
tux@localhost:~> kubectl get pods --all-namespaces
NAMESPACE     NAME                               READY   STATUS    RESTARTS   AGE
kube-system   cilium-82kz9                         1/1    Running   0          47m
kube-system   cilium-bzsp7                         1/1    Running   0          47m
kube-system   cilium-operator-7d6dddbf5-qnbp5      1/1    Running   0          50m
kube-system   cilium-rwwjw                         1/1    Running   0          47m
kube-system   coredns-69c4947958-75vdp            1/1    Running   1          50m
kube-system   coredns-69c4947958-vmf6d            1/1    Running   3          50m
kube-system   etcd-master01                        1/1    Running   0          49m
kube-system   kube-apiserver-master01              1/1    Running   0          49m
kube-system   kube-controller-manager-master01      1/1    Running   0          49m
kube-system   kube-proxy-2nhh6                      1/1    Running   0          50m
kube-system   kube-proxy-ftbck                     1/1    Running   0          47m
kube-system   kube-proxy-pj698                      1/1    Running   0          48m
kube-system   kube-scheduler-master01              1/1    Running   0          49m
kube-system   kubernetes-dashboard-5f9c6b756f-hkwxh 1/1    Running   0          45m
kube-system   kured-4qzsf                          1/1    Running   0          45m
kube-system   kured-7tcfj                          1/1    Running   0          49m
kube-system   kured-9z4g7                          1/1    Running   0          47m
kube-system   oidc-dex-55fc689dc-mccw8            1/1    Running   1          50m
kube-system   oidc-gangway-7b7fbbdbdf-4w6z8        1/1    Running   0          50m
kube-system   tiller-deploy-7c666b7c99-7whpp        1/1    Running   0          42m
tux@localhost:~> █
```

## Task 4: Add SUSE Charts to Helm

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to create a service account for Helm to use  
**helm repo add suse-charts <https://kubernetes-charts.suse.com>**
3. Look at available charts from SUSE

### **helm search suse**

```
tux@localhost:~> helm search suse
NAME          CHART VERSION APP VERSION DESCRIPTION
suse-charts/cf           2.17.1      1.4.1       A Helm chart for SUSE Cloud Foundry
suse-charts/cf-usb-sidecar-mysql 1.0.1       ...
suse-charts/cf-usb-sidecar-postgres 1.0.1       ...
suse-charts/console        2.4.0       2.4.0       A Helm chart for deploying Stratos UI Console
suse-charts/log-agent-rsyslog 1.0.1       8.39.0     Log Agent for forwarding logs of K8s control pl...
suse-charts/metrics         1.0.0       1.0.0       A Helm chart for Stratos Metrics
suse-charts/minibroker      0.2.0       ...
suse-charts/nginx-ingress   0.28.4      0.15.0     An nginx Ingress controller that uses ConfigMap...
suse-charts/uaa              2.17.1      1.4.1       A Helm chart for SUSE UAA
tux@localhost:~> █
```

## Task 5: Install Centralize Logging

1. On the **Workstation**, open a terminal
2. Enter the following command in the terminal to create a service account for Helm to use

```
helm install suse-charts/log-agent-rsyslog --name 1.0.1 --set server.host=rsyslog-server.default.svc.cluster.local --set server.port=514
```

---

### **Summary:**

In this exercise, you installed Helm on the Management workstation. You then setup and configured it to pull Charts directly from SUSE. You then installed the CaaS Platform's Centralized Logging Service.

(End of Exercise)

---

## 3 Deploying a Workload

### **Description:**

In this section you will deploy a simple workload in Kubernetes.

---

### **3- 1 Deploy a Simple Pod on Kubernetes**

### **Description:**

In this exercise, you deploy the Nginx web server as a simple pod on the Kubernetes cluster.

---

## Task 1: View a Manifest for the Deployment

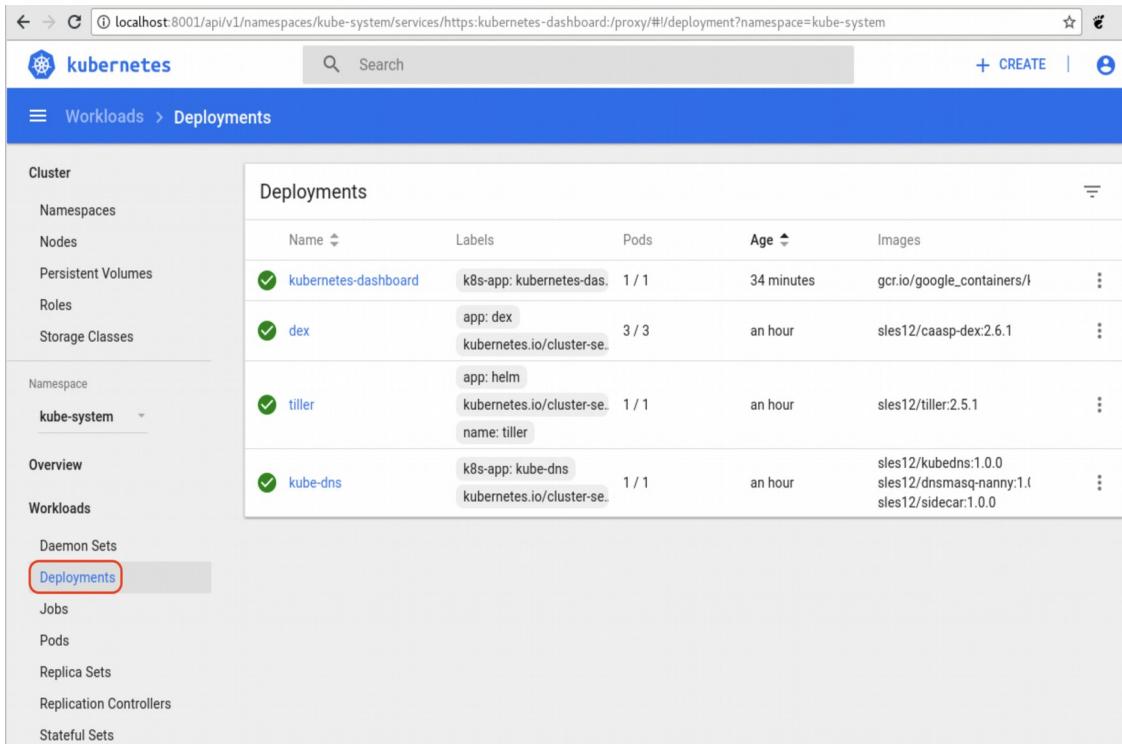

1. On the management workstation, in the text editor of your choice, open the file:  
**~/STW-CaaSPv4/labs/nginx-deployment.yaml**

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 4
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: smt.example.com:5000/sles12sp3_nginx
          ports:
            - containerPort: 80
```

## Task 2: Deploy a simple application (GUI option)

To deploy the application, go to the Kubernetes Dashboard

1. Click on **Deployments** on the left hand panel

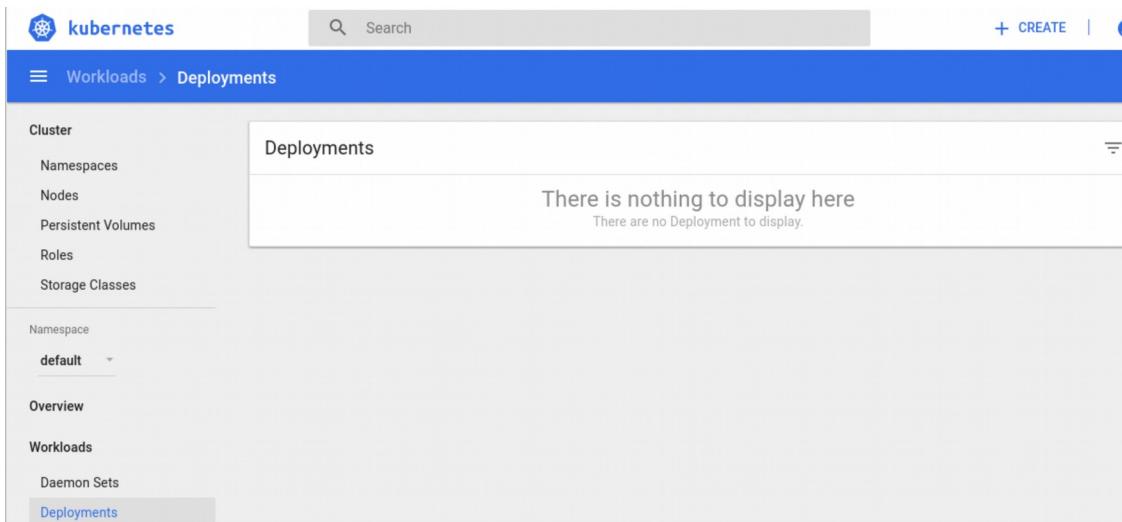

The screenshot shows the Kubernetes Dashboard interface. The left sidebar is titled 'Workloads' and includes options for Cluster, Namespaces, Nodes, Persistent Volumes, Roles, Storage Classes, Namespace (set to 'kube-system'), Overview, Workloads (Daemon Sets, Deployments, Jobs, Pods, Replica Sets, Replication Controllers, Stateful Sets), and a 'Deployments' button which is highlighted with a red box. The main content area is titled 'Deployments' and lists four entries:

Name	Labels	Pods	Age	Images
kubernetes-dashboard	k8s-app: kubernetes-dash-	1 / 1	34 minutes	gcr.io/google_containers/k
dex	app: dex kubernetes.io/cluster-se.	3 / 3	an hour	sles12/caasp-dex:2.6.1
tiller	app: helm kubernetes.io/cluster-se. name: tiller	1 / 1	an hour	sles12/tiller:2.5.1
kube-dns	k8s-app: kube-dns kubernetes.io/cluster-se.	1 / 1	an hour	sles12/kubedns:1.0.0 sles12/dnsmasq-nanny:1.0 sles12/sidecar:1.0.0

All of the currently deployed Deployments are in the kube-system namespace

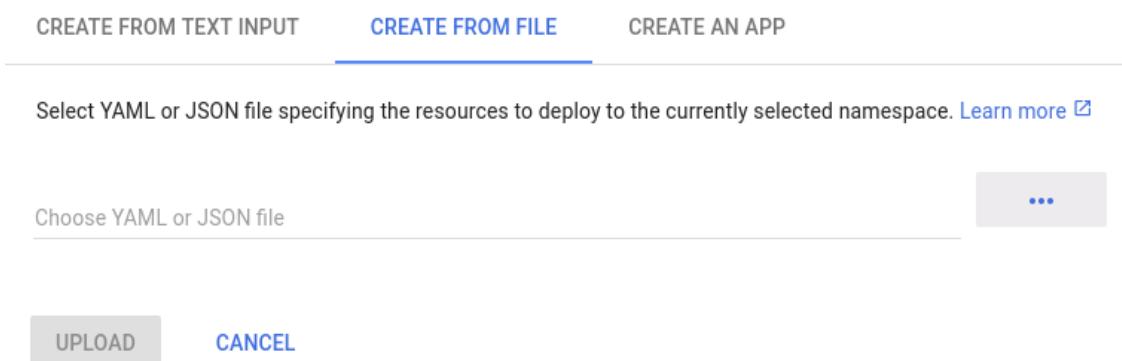

2. Select **Namespace** on the left hand panel
3. Change the **Namespace to Default** and select **Deployments** again

The screenshot shows the Kubernetes Dashboard interface with the 'default' namespace selected in the 'Namespace' dropdown on the left sidebar. The 'Deployments' button is also highlighted with a red box. The main content area displays a message: 'There is nothing to display here' and 'There are no Deployment to display.'

note there are no current deployments in the **default** namespace

4. Click on **+ CREATE**
5. Select **Create from File** and the press ‘...’ to select file

6. Browse to **~/STW-CaaSPv4/labs/nginx-deployment.yaml**
7. Press Upload
8. Select **Deployments** view and we should now see the nginx-deployment

The screenshot shows the 'Deployments' view in the Kubernetes Workloads section. The table displays one deployment named 'nginx-deployment' with the following details:

Name	Labels	Pods	Age	Images
nginx-deployment	app: nginx	1 / 1	32 seconds	nginx:1.7.9

## 9. Explore the Kubernetes Dashboard

Make sure you look at the **Overview, Workloads, and Pods** views

Name	Labels	Pods	Age	Images
nginx-deployment	app: nginx	4 / 4	4 minutes	smt.example.com:5000/sli

Name	Node	Status	Restarts	Age
nginx-deployment-58bd7995b-rq2t8	worker10	Running	0	4 minutes
nginx-deployment-58bd7995b-6gbsj	worker12	Running	0	4 minutes
nginx-deployment-58bd7995b-6sntr	worker10	Running	0	4 minutes
nginx-deployment-58bd7995b-nshqh	worker11	Running	0	4 minutes

Name	Labels	Pods	Age	Images
nginx-deployment-58bd791	app: nginx pod-template-hash: 146...	4 / 4	4 minutes	smt.example.com:5000/sli

## Task 3: Deploy a simple application (Command Line option)

10. To deploy the pod, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-deployment.yaml**

```
tux@management:~> kubectl apply -f ~/course_files/CAAS101/manifests/labs/nginx-deployment.yaml
2018-03-13 09:27:42.158048 I | proto: duplicate proto type registered: google.protobuf.Any
2018-03-13 09:27:42.158121 I | proto: duplicate proto type registered: google.protobuf.Duration
2018-03-13 09:27:42.158136 I | proto: duplicate proto type registered: google.protobuf.Timestamp
deployment "nginx-deployment" created
tux@management:~>
```

You should see the deployment “nginx-deployment” was created.

11. Enter the following command to view the deployments:

**kubectl get deployments**

You should see that a single instance of the **nginx-deployment** pod is running.

12. Enter the following command to view the deployed pods:

**kubectl get pods**

You should see a single instance of the **nginx-deployment** pod running.

---

**Summary:**

In this exercise, you launched a single instance of the Nginx web server as a pod in a deployment on the cluster.

(End of Exercise)

## **3- 2 Delete a Deployment on Kubernetes**

---

**Description:**

In this exercise, you delete the Nginx web server deployment that was previously deployed on the Kubernetes cluster.

---

### **Task 1: Delete the Deployment (GUI Option)**

1. Select **nginx-deployment** under Deployments
2. Select **Delete**

The screenshot shows the Kubernetes interface within the SUSE CaaS Platform. The top navigation bar includes 'kubernetes', a search bar, and buttons for '+ CREATE', 'SCALE', 'EDIT', and 'DELETE'. The main content area shows the 'Workloads > Deployments > nginx-deployment' view. On the left sidebar under 'Cluster' and 'Namespaces', 'default' is selected. Under 'Overview', it shows 10 updated, 10 total, 10 available, and 0 unavailable pods. The 'Workloads' section has tabs for 'Daemon Sets', 'Deployments' (which is selected), 'Jobs', 'Pods', and 'Replica Sets'. The 'Deployments' tab displays a table for a 'New Replica Set' named 'nginx-deployment-431080'. The table columns are Name, Labels, Pods, Age, and Images. The row for the replica set shows 'nginx-deployment-431080' with labels 'app: nginx' and 'pod-template-hash: 431..', status '10 / 10', age '39 minutes', and image 'nginx:1.7.9'. There are also filter and more options icons.

## Task 2: Delete the Deployment (Command Line option)

- To view the deployments, on the Workstation, enter the following command:

**kubectl get deployments**

You should see that one instance of the **nginx-deployment** is running.

- Enter the following command to delete the deployment:

**kubectl delete deployment nginx-deployment**

You should see the **nginx-deployment** was deleted.

- View the deployments again:

**kubectl get deployments**

You should see that the **nginx-deployment** is no longer running.

- View the pods:

**kubectl get pods**

You should see that all of the pods that were part of the **nginx-deployment** are no longer running.

---

## Summary:

In this exercise, you deleted the Nginx web server deployment that was previously deployed on the cluster.

(End of Exercise)

## 3- 3 Scale Out a Deployment

---

### Description:

In this exercise, you scale out a running Deployment.

---

### Task 1: View the Manifest for the Deployment

1. In the text editor of your choice, view the **~/STW-CaaSPv4/labs/nginx-deployment.yaml** file

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 4
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: smt.example.com:5000/sles12sp3_nginx
          ports:
            - containerPort: 80
```

### Task 2: Scale the Deployment (GUI option)

1. From **Kubernetes Dashboard** select **Create** and open  
**~/STW-CaaSPv4/labs/nginx-scale.yaml**

2. Press the **Deploy** button
3. Select the **nginx-deployment** under **Deployments**

4. click the **Scale** Button and change the number of **Desired pods** to 10

The screenshot shows the Kubernetes UI for the 'nginx-deployment' in the 'default' namespace. The left sidebar is collapsed. The main area shows the deployment details:

- Name:** nginx-deployment
- Namespace:** default
- Labels:** app: nginx
- Selector:** app: nginx
- Strategy:** RollingUpdate
- Min ready seconds:** 0
- Revision history limit:** Not set
- Rolling update strategy:** Max surge: 1, Max unavailable: 1
- Status:** 1 updated, 1 total, 1 available, 0 unavailable

Below the details, there are sections for **New Replica Set** and **Old Replica Sets**. The New Replica Set table shows one pod named 'nginx-deployment-431080787-431080787-431080787-431080787-431080787-431080787-431080787-431080787-431080787-431080787'. The Old Replica Sets section says 'There is nothing to display here'.

5. View the deployed pods by selecting **Pods** in the left hand panel

The screenshot shows the Kubernetes UI for the 'Pods' list. The left sidebar is collapsed. The main area shows the pod list for the 'nginx-deployment' in the 'default' namespace:

Name	Node	Status	Restarts	Age
nginx-deployment-431080787-15rg9	b099b425f0194d18902aa	Running	0	5 minutes
nginx-deployment-431080787-bjd3j	dda6d06e26214c6d9c208	Running	0	5 minutes
nginx-deployment-431080787-ck5g4	b099b425f0194d18902aa	Running	0	5 minutes
nginx-deployment-431080787-fm6db	e8185390bbc544efba496!	Running	0	5 minutes
nginx-deployment-431080787-fp09k	dda6d06e26214c6d9c208	Running	0	5 minutes
nginx-deployment-431080787-fx8m3	e8185390bbc544efba496!	Running	0	5 minutes
nginx-deployment-431080787-gshzg	b099b425f0194d18902aa	Running	0	5 minutes
nginx-deployment-431080787-gtrmb8	b099b425f0194d18902aa	Running	0	5 minutes
nginx-deployment-431080787-mdx66	e8185390bbc544efba496!	Running	0	5 minutes
nginx-deployment-431080787-if344	dda6d06e26214c6d9c208	Running	0	12 minutes

6. Scale the Pods back down to 4

## Task 3: Scale the Deployment (Command Line Option)

1. In the text editor of your choice, open the **~/STW-CaaSPv4/labs/nginx-scale.yaml** file

Note the the only difference is the number of replicas

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 10
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: smt.example.com:5000/sles12sp3_nginx
          ports:
            - containerPort: 80
```

2. To scale the deployment, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-scale.yaml**

3. Enter the following command to view the deployments:

**kubectl get deployments**

You should see that one instance of the **nginx-deployment** Deployment is running.

4. Enter the following command to view the deployed pods:

**kubectl get pods**

You should see 10 instances of the **nginx-deployment** pod running.

---

### Summary:

In this exercise, you created a new manifest for an existing deployment that specified a smaller number of replicas. You then applied the updated manifest to scale in the deployment. Finally you applied the original manifest to scale the deployment back out.

(End of Exercise)

## 4 Working With Kubernetes

---

### Description:

In this section you are introduced to how to work with Kubernetes. You are first introduced to Kubernetes configuration and management utilities and manifests. You then deploy and manage pods on a Kubernetes cluster.

### 4- 1 Update a Deployment

---

#### Description:

In this exercise, you update a running pod.

#### Task 1: Create a New Manifest for the Deployment

1. In the text editor of your choice, open the **~/STW-CaaSPv4/labs/nginx-update.yaml** file
2. Notice the section in **red**

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 4
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: rmt.example.com:5000/nginx:1.9.0
          ports:
            - containerPort: 80
```

## Task 2: Update the Deployment

1. If you don't already have **nginx** deployed Deploy either through **KubeDashboard** using the file **~/STW-CaaSPv4/labs/nginx-pre-update.yaml** or the following command line:  
**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-pre-update.yaml**
2. To display information on the current nginx deployment enter the following command:  
**kubectl describe deployment -l app=nginx**

You should see the description of the nginx deployment displayed.

Notice the image version is: nginx:1.7.9

3. Open another terminal and enter the following command to watch the running pods:

**watch kubectl get pods**

You should see a list of the running pods displayed with the list updating every 2 seconds.

4. To update the deployment, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-update.yaml**

You should see the deployment "nginx-deployment" was configured.

5. Enter the following command to view the deployments:

**kubectl get deployments**

You should see that 4 instances of the **nginx-deployment** pod are DESIRED and, depending on when you ran the command, the values in the CURRENT, UP-TO-DATE and AVAILABLE columns may be more, fewer or the same number as the update happens .

6. In the terminal where you are watching the pods enter **ctrl+c** to stop the watch command
7. Enter the following command to display information about the running deployment of nginx:

**kubectl describe pods -l app=nginx**

Notice the image version is now: nginx:1.9.0

---

### Summary:

In this exercise, you created a new manifest to update the running nginx deployment. You then updated the deployment and verified that it was updated.

## 4- 2 Update a Deployment Via Rolling Updates

---

### Description:

In this exercise, you update a running pod using rolling updates.

---

### Task 1: Create a New Manifest for the Deployment

1. On the management workstation, In the text editor of your choice, open the **~/STW-CaaSPv4/labs/nginx-rolling\_update.yaml** file
2. Notice the changes are in **red**

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 4
  revisionHistoryLimit: 5
  minReadySeconds: 20
  strategy:
    type: RollingUpdate
    rollingUpdate:
      maxUnavailable: 25%
      maxSurge: 2
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: rmt.example.com:5000/nginx:1.12.0
      ports:
        - containerPort: 80
```

3. Save the file and close the text editor

## Task 2: Update the Deployment

1. To display information on the current nginx deployment enter the following command:

**kubectl describe deployment -l app=nginx**

You should see the description of the nginx deployment displayed.

Notice the image version is: `nginx:1.9.0`

2. Open another terminal and enter the following command to watch the running pods:

**watch kubectl get pods**

You should see a list of the running pods displayed with the list updating every 2 seconds.

3. To update the deployment, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-rolling\_update.yaml**

You should see the deployment “nginx-deployment” was configured.

In the terminal where you are watching the pods you should see the number of running pods drop to 3 (because of maxUnavailable: 25%) and 3 new pods start deploying. Shortly after the 3 new pods are running you should see the number of running pods scale up to 6 (because of maxSurge: 2) and then back to 4.

4. Enter the following command to view the deployments:

**kubectl get deployments**

You should see that 4 instances of the `nginx-deployment` pod are running.

5. In the terminal where you are watching the pods enter **ctrl+c** to stop the watch command
6. Enter the following command to display information about the running deployment of nginx:

**kubectl describe deployment -l app=nginx**

Notice the image version is now: `nginx:1.12.0`

---

### Summary:

In this exercise, you created a new manifest to update the running nginx deployment using the rolling update type. You then updated the deployment and verified that it was updated.

(End of Exercise)

---

## 4- 3 Expose a Service Running in a Pod

---

### Description:

In this exercise, you expose a service running in a pod.

---

### Task 1: Create a Manifest for the Service

1. On the Workstation, in the text editor of your choice, open the file:

**~/STW-CaaSPv4/labs/nginx-service.yaml**

```
apiVersion: v1
kind: Service
metadata:
  name: nginx-service
spec:
  type: NodePort
  ports:
    - port: 80
      nodePort: 30000
  selector:
    app: nginx
```

### Task 2: Define the Service

1. To define the service in the cluster, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-service.yaml**

You should see the service “nginx-service” was created.

2. Enter the following command to view the services:

**kubectl get services**

You should see that the **nginx-service** service is defined. Notice the 80:30000 under ports showing external port 30000 will be redirected into internal port 80.

### Task 3: Access the Exposed Service

1. To access the exposed service, open a web browser and point to:

**http://worker.example.com:30000**

You should see the Welcome to nginx web page.

**Note:**

If desired, you can change the URL to point to a specific worker node (i.e. **worker10.example.com**) and see that the web page is still accessible. This demonstrates that the kube-proxy is working on all of the cluster nodes.

---

**Summary:**

In this exercise, you defined a service in the cluster exposing port 80 that allowed access to the nginx pod running on the cluster. You then accessed the nginx pod in a web browser.

(End of Exercise)

---

## 4- 4 Setup Readiness and Liveness Probes

---

**Description:**

In this exercise, you learn how to setup and configure Readiness and Liveness Probes

---

### Task 1: View manifest for the Deployment

1. In the text editor of your choice, open the **~/STW-CaaSPv4/labs/nginx-deployment-health.yaml** file

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 4
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: smt.example.com:5000/sles12sp3_nginx
          ports:
            - containerPort: 80
          readinessProbe:
            httpGet:
              path: /
              port: 80
            initialDelaySeconds: 5
            timeoutSeconds: 1
            periodSeconds: 15
          livenessProbe:
            httpGet:
              path: /
              port: 80
            initialDelaySeconds: 15
            timeoutSeconds: 1
            periodSeconds: 15
```

2. Notice the ReadinessProbe and LivenessProbe settings

## Task 2: Deploy Manifest

1. Deploy the manifest

**kubectl apply -f ~/STW-CaaSPv4/labs/nginx-deployment-health.yaml**

## Task 3: View the Replica sets

2. On the lefthand side of the Kubernetes Dashboard, under Workload, select Replica Sets

Name	Node	Status	Restarts	Age	CPU (cores)	Memory (bytes)
nginx-deploymer	worker12	Running	1	an hour	0	9.359 Mi
nginx-deploymer	worker11	Running	0	an hour	0	9.504 Mi
nginx-deploymer	worker10	Running	1	an hour	0	9.348 Mi
nginx-deploymer	worker10	Running	0	an hour	0	9.355 Mi

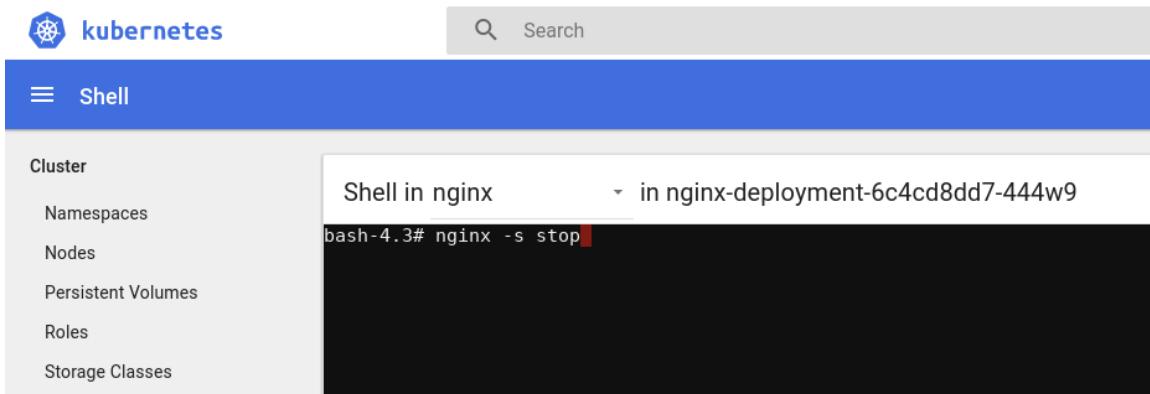

3. Notice the number of Restarts on the container

## Task 4: Kill an nginx server

1. Select one of the pods labeled nginx-deployment-#### by clicking on it
2. Click the EXEC button to be taken to a shell prompt inside the running pod

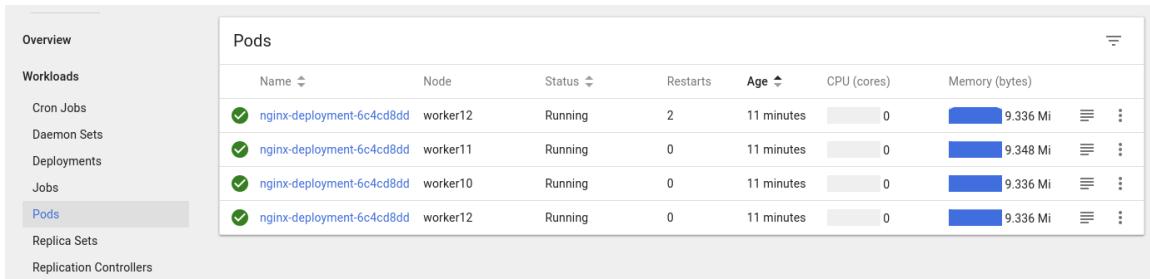

Memory usage
0 Mi

- From the Shell enter the following command to kill the nginx process  
**nginx -s stop**

The screenshot shows the Kubernetes UI with a "Shell" tab selected. On the left, a sidebar lists "Cluster", "Namespaces", "Nodes", "Persistent Volumes", "Roles", and "Storage Classes". The main area is titled "Shell in nginx" and "in nginx-deployment-6c4cd8dd7-444w9". It displays a terminal session with the command "bash-4.3# nginx -s stop" entered.

- Click on Pods to view the current pods running

The screenshot shows the Kubernetes UI with the "Pods" tab selected under the "Workloads" section. The sidebar also shows "Overview", "Cron Jobs", "Daemon Sets", "Deployments", "Jobs", "Replica Sets", and "Replication Controllers". The main table lists four pods from the "nginx-deployment" deployment, each running on a different worker node (worker12, worker11, worker10, worker12) and having 0 restarts.

Name	Node	Status	Restarts	Age	CPU (cores)	Memory (bytes)	⋮
nginx-deployment-6c4cd8dd	worker12	Running	2	11 minutes	0	9.336 Mi	⋮
nginx-deployment-6c4cd8dd	worker11	Running	0	11 minutes	0	9.348 Mi	⋮
nginx-deployment-6c4cd8dd	worker10	Running	0	11 minutes	0	9.336 Mi	⋮
nginx-deployment-6c4cd8dd	worker12	Running	0	11 minutes	0	9.336 Mi	⋮

- Notice the number of restarts has increased. This is because Kubernetes could no longer reach the server on port 80 so it restarted that Nginx Container inside the Pod

---

### Summary:

In this exercise, you created a new manifest to update the running nginx deployment. You then updated the deployment and verified that it was updated.

(End of Exercise)

## 4- 5 Define Limits for Containers and Pods in Kubernetes

---

### Description:

In this exercise, you define limits for containers and pods in the Kubernetes cluster.

---

## Task 1: Create a New Namespace in the Cluster

1. On the Workstation, at the command line, enter the following command to create a new namespace in the Kubernetes cluster:

**kubectl create namespace limit-example**

You should see that a new namespace was created.

2. Enter the following command to display the namespaces:

**kubectl get namespaces**

You should see the new namespace listed.

## Task 2: Create a Manifest for the Limits

1. In the text editor open the file:

**~/STW-CaaSPv4/labs/limits.yaml**

```
apiVersion: v1
kind: LimitRange
metadata:
  name: mylimits
spec:
  limits:
  - max:
      cpu: "2"
      memory: 1Gi
    min:
      cpu: 200m
      memory: 6Mi
    type: Pod
  - default:
      cpu: 300m
      memory: 200Mi
    defaultRequest:
      cpu: 200m
      memory: 100Mi
    max:
      cpu: "2"
      memory: 1Gi
    min:
      cpu: 100m
      memory: 3Mi
    type: Container
```

## Task 3: Apply the Limits to the Namespace

1. To deploy the pod, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/limits.yaml --namespace=limit-example**

You should see the limitrange “mylimits” was created.

2. Enter the following command to display the limitranges:

**kubectl describe limitranges --namespace=limit-example**

You should see the **mylimits** limitrange listed.

## SUSE U Advanced - SUSE CaaS Platform

Name:	mylimits	Namespace:	limit-example	Type	Resource	Min	Max	Default Request	Default Limit	Max Limit/Request Ratio
Pod	cpu			Pod	cpu	200m	2	-	-	-
Pod	memory			Pod	memory	6Mi	1Gi	-	-	-
Container	cpu			Container	cpu	100m	2	200m	300m	-
Container	memory			Container	memory	3Mi	1Gi	100Mi	200Mi	-

---

### **Summary:**

In this exercise, you created a new namespace in the Kubernetes cluster. You then defined limits for containers and pods and applied them to the new namespace.

(End of Exercise)

---

## **4- 6 Introduction to Helm**

---

### **Description:**

In this exercise, you are introduced to the helm utility.

---

### **Task 1: Use Some Basic Helm Commands**

1. In a terminal, enter the following command to source the Helm auto-completion functions into your shell environment:

**source <(helm completion bash)**

Your shell environment should now have the helm auto-completion functions available.

2. Enter the following command to display a list of available helm charts:

**helm search**

You should see a list of available helm charts listed.

3. Try running the command again but rather than typing in the entire command, only type:

**helm sea[Tab]**

(Where [Tab] is the tab key)

Notice that the “**search**” option is auto-completed.

4. Enter the following command to search for a specific helm chart:

**helm search dokewiki**

You should see the dokewiki chart listed.

5. Enter the following command to display the list of currently configured repos:

### **helm repo list**

You should see a repo for <https://kubernetes-charts.storage.googleapis.com>, [kubernetes-charts.suse.com](https://kubernetes-charts.suse.com) and an addition to the local repo.

---

#### **Summary:**

In this exercise, you initialized helm. You then ran some basic helm commands such as configuring auto-completion, searching for helm charts and displaying repositories.

(End of Exercise)

## **4- 7 Deploy an Application with Helm**

---

#### **Description:**

In this exercise, you deploy an application from a helm chart using the helm command.

---

### **Task 1: Create Helm Chart Config File**

1. On the Workstation, in a terminal, enter the following command to search for a dokuwiki helm chart:

#### **helm search dokuwiki**

You should see a helm chart named stable/dokuwiki listed with its available chart version.

2. Enter the following command to view the default configuration for the dokuwiki chart:

#### **helm inspect stable/dokuwiki | less**

You should see the configuration displayed in the less pager. Page through the configuration to see what variables are being set.

3. In the text editor of your choice, create/open the **~/STW-CaaSPv4/labs/dokuwiki-config.yaml** file
4. Enter the following in the file:

**dokuwikiPassword: password123**  
**serviceType: NodePort**  
**persistence:**  
**enabled: false**

5. Save the file and close the text editor

## Task 2: Deploy the Helm Chart

1. In a terminal, enter the following command to view the current helm releases:

### **helm list**

You should not see the **dokuwiki** application listed.

2. Enter the following command to deploy the chart:

### **helm install -f ~/STW-CaaSPv4/labs/dokuwiki-config.yaml --name mywiki stable/dokuwiki**

You should see the chart was deployed.

In the output of the chart deployment, in the **==> v1/Service** section, notice the IP and port(s) the application is listening on. The NodePort(s) that the application is listening on are the number after the colon (**:**) in the **PORT(S)** column.

Example: **80:32313/TCP,443:31034/TCP**

In this example the NodePorts are **32313** for http and **31034** for https.

Record the http NodePort here:

**DOKUWIKI\_PORT=**\_\_\_\_\_

3. Enter the following command to display the current helm releases:

### **helm list**

You should now see the **dokuwiki** chart listed with a name of **mywiki**. Notice the **REVISION** column shows the number **1** as this is the initial deployment of this release.

4. Enter the following command to view the release history for the application:

### **helm history mywiki**

You should see that only a single release of **mywiki** exists.

5. Enter the following command to view the status of the **mywiki** release:

### **helm status mywiki**

You should see output similar to what was displayed when the chart was first deployed.

6. You can also enter the following **kubectl** commands:

**kubectl get deployments**

**kubectl get pods**

**kubectl get services**

Notice that you see that same info about the deployed deployments/pods/services as if you were to have deployed them from manifests.

## Task 3: Access the Application Deployed by the Helm Chart

1. Open a web browser and point to:

## **[http://worker.example.com:DOKUWIKI\\_PORT](http://worker.example.com:DOKUWIKI_PORT)**

You should see the **My Wiki** page displayed.

2. On the top right of the page click: **Login**
3. Enter the following credentials:

**Username:** user

**Password:** password123

You should be logged in.

After logging in you probably see a number of warnings of available hotfixes and/or updates.

## **Task 4: Update the Application Release**

1. On the **Workstation**, in a terminal, make a copy of the chart config file you created at the beginning of this exercise:

**cp ~/dokewiki-config.yaml ~/dokewiki-config-update.yaml**

2. In the text editor of your choice, open the **~/dokewiki-config-update.yaml** file
3. Edit the file to match the following (changes are in **red**):

**images: bitnami/dokewiki:latest**

**dokewikiPassword: password123**

**serviceType: NodePort**

**persistence:**

**enabled: false**

4. Save the file and close the text editor

5. Enter the following command to upgrade the **mywiki** release:

**helm upgrade -f ~/dokewiki-config-update.yaml mywiki stable/dokewiki**

You should see the chart was successfully deployed.

6. Enter the following command to view the current helm releases:

**helm list**

You should see the **dokewiki** chart named **mywiki** listed. Notice the **REVISION** column now shows the number **2** as the release has been updated once.

7. Enter the following command to display the release history for the **mywiki** release:

**helm history mywiki**

Notice that there are 2 revisions. Also notice the the first revision's **STATUS** is **SUPERSEDED** and the second revision's **STATUS** is **DEPLOYED**.

8. In the web browser, refresh the web page (or log back in if you have logged out)

You should no longer see the warning messages about available hotfixes and/or

updates.

## Task 5: Delete a Deployed Helm Chart Release

1. In a terminal, enter the following command to delete the **mywiki** release:

**helm delete mywiki**

You should see that the release was deleted.

2. Enter the following command to list the current helm releases:

**helm list**

You should no longer see the **dokewiki** chart named **mywiki** displayed.

3. Enter the following command to display the status of the **mywiki** release:

**helm status mywiki**

Notice that the **STATUS** is **DELETED** but also that it remembered that it had been deployed as it has a date listed in **LAST DEPLOYED**.

---

### Summary:

In this exercise, you first deployed a helm chart. You then accessed the application that was deployed. Next you updated the release, verifying it was updated. Finally you deleted the release.

(End of Exercise)

---

## 5 Storage

---

### Description:

How to handle persistent storage in pods.

## 5- 1 Configure NFS Persistent Storage

---

### Description:

In this exercise, you configure a persistent volume on an NFS server. You then create a pod that updates a file on the persistent volume and a pod that exports the file via http

---

### Task 1: Create the Persistent Volume on the NFS Server

1. On the SMT server, as the **root** user with the password of **Linux** enter the following commands in a terminal session to create the persistent volume and **index.html** file:

```
mkdir -p /export/vol-01
touch /export/vol-01/index.html
```

The directory and file should now exist.

### Task 2: Create the Manifest for the Persistent Volume

2. On the CAAS101-management VM, in the text editor of your choice, open the file:

```
~/course_files/CAAS101/manifests/labs/pv/nfs-pv-vol-01.yaml
```

Enter the following in the file:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: nfs-vol-01
spec:
  capacity:
    storage: 1Mi
  accessModes:
    - ReadWriteMany
  nfs:
    # FIXME: use the right IP
    server: 192.168.110.2
    path: "/export/vol-01"
```

### Task 3: Create the Manifest for the Persistent Volume Claim

1. In the text editor of your choice, open the file:

~/course\_files/CAAS101/manifests/labs/pv/nfs-pvc-vol-01.yaml

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: nfs-vol-01
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 1Mi
```

## Task 4: Create the Manifest for the Busybox Instance

1. In the text editor of your choice, open the file:

~/course\_files/CAAS101/manifests/labs/pv/nfs-busybox-deployment.yaml

```
# This mounts the nfs volume claim into /mnt and continuously
# overwrites /mnt/index.html with the time and hostname of the pod.

apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nfs-busybox
spec:
  replicas: 1
  template:
    metadata:
      labels:
        name: nfs-busybox
    spec:
      containers:
        - image: smt.example.com:5000/busybox
          command:
            - sh
            - -c
            - 'while true; do date > /mnt/index.html; hostname >> /mnt/index.html; sleep $($RANDOM % 5 + 5)); done'
          imagePullPolicy: IfNotPresent
          name: busybox
      volumeMounts:
        # name must match the volume name below
        - name: nfs-vol-01
          mountPath: "/mnt"
  volumes:
    - name: nfs-vol-01
      persistentVolumeClaim:
        claimName: nfs-vol-01
```

## Task 5: Create the Manifests for the Web Frontend

1. In the text editor of your choice, create/open the file:

~/course\_files/CAAS101/manifests/labs/pv/nfs-web-deployment.yaml

```
# This pod mounts the nfs volume claim into /usr/share/nginx/html and
# serves a simple web page.

apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nfs-web
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: web-frontend
    spec:
      containers:
      - name: web
        image: smt.example.com:5000/nginx
        ports:
        - name: web
          containerPort: 80
      volumeMounts:
        # name must match the volume name below
        - name: nfs-vol-01
          mountPath: "/usr/share/nginx/html"
  volumes:
  - name: nfs-vol-01
    persistentVolumeClaim:
      claimName: nfs-vol-01
```

2. Next, open the file:

**`~/course_files/CAAS101/manifests/labs/pv/nfs-web-service.yaml`**

```
apiVersion: v1
kind: Service
metadata:
  name: nfs-web
spec:
  type: NodePort
  ports:
  - port: 80
    nodePort: 30080
  selector:
    app: web-frontend
```

## Task 6: Deploy the Objects

1. To deploy the volumes/pods/service, open a terminal and enter the following command:

**`kubectl apply -f ~/course_files/CAAS101/manifests/labs/pv`**

You should see the following were created (not necessarily in this order):

deployment “nfs-busybox”  
persistentvolume “nfs-vol-01”  
persistenvolumeclaim “nfs-vol-01”  
deployment “nfs-web”  
deployment “nfs-web”

2. Enter the following command to view the deployments:

### **kubectl get deployments**

You should see the **nfs-busybox** and **nfs-web** deployments listed.

3. Enter the following command to view the pods:

### **watch kubectl get pods**

You should see the pods for the **nfs-busybox** and **nfs-web** deployments listed.

4. Enter the following command to view the persistent volumes:

### **kubectl get pv**

You should see the persistent volume **nfs-vol-01** listed.

5. Enter the following command to view the persistent volumes:

### **kubectl get pvc**

You should see the persistent volume claim **nfs-vol-01** listed.

## Task 7: Test the Persistent Data

1. On the **SMT server**, enter the following command to view the content of the **index.html** file on the NFS server:

### **cat /export/vol-01/index.html**

You should see a line with the date and time and a line with the pod name of the **nfs-busybox** pod. If you rerun the command you should see that the time stamp is updating.

2. On the **management workstation**, open a web browser and point to:

**http://worker10.example.com:30080**

You should see the content of the **index.html** file. When you refresh the page you should see the time stamp updating. (Also notice that if you change the URL to the different worker nodes you will see the same thing.)

## Task 8: Remove the Objects from the Cluster

1. In the first terminal, enter the following commands to delete all of the objects:

```
kubectl delete service nfs-web
kubectl delete deployment nfs-web
kubectl delete deployment nfs-busybox
kubectl delete pv nfs-vol-01
kubectl delete pvc nfs-vol-01
```

You should see that the objects were deleted.

---

### Summary:

In this exercise, you created manifests for a persistent volume, a persistent volume claim, a pod to that attached to the volume and writes data to an index.html file in the volume, and a web server that attaches to the volume and displays the index.html file. You then verified that the index.html file was being updated by looking at the file both on the NFS volume and the web server.

(End of Exercise)

## 5- 2 Configure Persistent Storage with a NFS StorageClass

---

### Description:

In this exercise, you define a StorageClass that will automatically create volumes on an NFS server. You then create a volume claim that will cause the volume to be created on the NFS server and a pod that will write a file in the volume.

---

### Task 1: Create the Directory for the Persistent Volumes on the NFS Server

1. On the **SMT server**, as the **root** user with a password of **Linux**, enter the following commands to create the directory that will contain the volumes:

```
mkdir -p /export/volumes
chmod 777 /export/volumes
```

The directory and file should now exist.

### Task 2: Define a Service Account, Cluster Role and Cluster Role Binding

1. On the **CAAS101-management VM**, in the text editor of your choice, open the file:  
**~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/auth/serviceaccount.yaml**

```
apiVersion: v1
kind: Service
metadata:
  name: nfs-web
spec:
  type: NodePort
  ports:
    - port: 80
      nodePort: 30080
  selector:
    app: web-frontend
```

2. In the text editor of your choice, open the file:
3. **~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/auth/clusterrole.yaml**

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1beta1
metadata:
  name: nfs-client-provisioner-runner
rules:
- apiGroups: [""]
  resources: ["persistentvolumes"]
  verbs: ["get", "list", "watch", "create", "delete"]
- apiGroups: [""]
  resources: ["persistentvolumeclaims"]
  verbs: ["get", "list", "watch", "update"]
- apiGroups: ["storage.k8s.io"]
  resources: ["storageclasses"]
  verbs: ["get", "list", "watch"]
- apiGroups: [""]
  resources: ["events"]
  verbs: ["list", "watch", "create", "update", "patch"]
```

4. In the text editor of your choice, open the file:

**~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/auth/clusterrolebinding.yaml**

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1beta1
metadata:
  name: run-nfs-client-provisioner
subjects:
- kind: ServiceAccount
  name: nfs-client-provisioner
  namespace: default
roleRef:
  kind: ClusterRole
  name: nfs-client-provisioner-runner
  apiGroup: rbac.authorization.k8s.io
```

5. Enter the following command to open the service, clusterrole and clusterrolebinding:

```
kubectl apply -f ~/course_files/CAAS101/manifests/labs/nfs-client-storageclass/auth
```

You should see the following were created (not necessarily in this order):

serviceaccount “nfs-client-provisioner”  
clusterrole “nfs-client-provisioner-runner”  
clusterrolebinding “run-nfs-client-provisioner”

6. Enter the following command to view the service accounts:

```
kubectl get serviceaccounts
```

You should see `nfs-client-provisioner` listed.

7. Enter the following command to view the cluster roles:

```
kubectl get clusterroles
```

You should see `nfs-client-provisioner-runner` listed.

### Task 3: Define a Storage Class

1. On the CAAS101-management VM, in the text editor of your choice, open the file:

```
~/course_files/CAAS101/manifests/labs/nfs-client-storageclass/deploy/class.yaml
```

```
apiVersion: v1beta1
kind: ServiceAccount
metadata:
  name: nfs-client-provisioner
```

2. In the text editor of your choice, open the file:

```
~/course_files/CAAS101/manifests/labs/nfs-client-storageclass/deploy/deployment.yaml
```

```
kind: Deployment
apiVersion: extensions/v1beta1
metadata:
  name: nfs-client-provisioner
spec:
  replicas: 1
  strategy:
    type: Recreate
  template:
    metadata:
      labels:
        app: nfs-client-provisioner
    spec:
      containers:
        - name: nfs-client-provisioner
          image: smt.example.com:5000/quay.io/external_storage/nfs-client-provisioner:latest
          volumeMounts:
            - name: nfs-client-root
              mountPath: /persistentvolumes
      env:
        - name: PROVISIONER_NAME
          value: smt.example.com
        - name: NFS_SERVER
          value: 192.168.110.2
        - name: NFS_PATH
          value: /export/volumes
      serviceAccount: nfs-client-provisioner
      serviceAccountName: nfs-client-provisioner
    volumes:
      - name: nfs-client-root
        nfs:
          server: 192.168.110.2
          path: /export/volumes
```

3. Enter the following command to create the storage class and provisioner:

**kubectl apply -f ~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/deploy**

You should see the following were created (not necessarily in this order):

storageclass “managed-nfs-storage”  
deployment “nfs-client-provisioner”

4. Enter the following command to view the service accounts:

**kubectl get storageclasses**

You should see **managed-nfs-storage** listed.

5. Enter the following command to view the cluster roles:

**kubectl get deployments**

You should see **nfs-client-provisioner** listed.

## Task 4: Create a Persistent Volume Claim and Pod that Uses It

6. On the CAAS101-management VM, in the text editor of your choice, open the file:

**~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/test/test-claim.yaml**

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-claim
  annotations:
    volume.beta.kubernetes.io/storage-class: "managed-nfs-storage"
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 1Mi
```

7. In the text editor of your choice, open the file:

**~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/test/test-pod.yaml**

```
kind: Pod
apiVersion: v1
metadata:
  name: test-pod
spec:
  containers:
    - name: test-pod
      image: smt.example.com:5000/gcr.io/google_containers/busybox:1.24
      command:
        - "/bin/sh"
      args:
        - "-c"
        - "touch /mnt/SUCCESS && exit 0 || exit 1"
      volumeMounts:
        - name: nfs-pvc
          mountPath: "/mnt"
    restartPolicy: "Never"
  volumes:
    - name: nfs-pvc
      persistentVolumeClaim:
        claimName: test-claim
```

8. Enter the following command to create the volume claim and the pod:

**kubectl apply -f ~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/test**

You should see the following were created (not necessarily in this order):

persistentvolumeclaim “test-claim”  
pod “test-pod”

9. Enter the following command to view the persistent volume claims:

**kubectl get pvc**

You should see **test-claim** listed.

10. Enter the following command to view the details about the volume claim:

**kubectl describe pvc test-claim**

Under the **Events** section you should see that the provisioner successfully provisioned the volume followed by the name of the volume. Record the name of the volume here:

**NFS\_VOLUME\_NAME=** \_\_\_\_\_

This will be in the directory name you will see on the NFS server

11. Enter the following command to view the pods:

**kubectl get pods**

You should note see **test-pod** listed because it was defined to deploy, run a command to write a file to the volume and then exit.

12. On the **SMT server**, enter the following command to view the directory that was created for the volume:

**ls -l /export/volumes/**

You should see a directory named:

**default-test-claim-NFS\_VOLUME\_NAME**

13. Enter the following command:

**ls -l /export/volumes/default-test-claim-NFS\_VOLUME\_NAME**

You should see a file named: **SUCCESS**

## Task 5: Create a Persistent Volume Claim and Pod that Uses It

14. On the **CAAS101-management VM**, enter the following command to remove the volume claim:

**kubectl delete pvc test-claim**

You should see that the persistentvolumeclaim was deleted.

15. Enter the following command to view the persistent volume claims:

**kubectl get pvc**

You should no longer see **test-claim** listed.

16. On the **SMT server**, enter the following command to view the directory that was created for the volume:

**ls -l /export/volumes/**

You should see that the directory for the volume has been renamed to:

**archived-default-test-claim-NFS\_VOLUME\_NAME**

If desired, you could apply the manifests in the test directory again to see another directory created.

## Task 6: Remove the Objects from the Cluster

1. On the **CAAS101-management VM**, in the first terminal, enter the following commands to delete all of the objects:

**kubectl delete -f ~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/test**

**kubectl delete -f ~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/deploy**

**kubectl delete -f ~/course\_files/CAAS101/manifests/labs/nfs-client-storageclass/auth**

You should see that the objects were deleted.

---

### Summary:

In this exercise, you created manifests for a service account, a role, a role binding, a storageclass, a persistent volume claim, a pod to that attached to the volume and writes data to a file in the volume. You then verified that the volume was being created and the file in it was created on the NFS server.

(End of Exercise)

## 6 Deploying Advanced Workload

---

### Description:

How to deploy a workload from an existing Docker Image

### 6- 1 Run Heimdall as a standalone container

---

#### Description:

In this exercise, you configure and run Heimdall as standalone container

---

#### Task 1: Create a place for Heimdall to store it's files

1. On the Workstation, enter the following commands in a terminal session to create the ~/docker/heimdall folder:

```
sudo mkdir -p /docker/heimdall  
sudo chmod 777 /docker -R  
cd /docker/heimdall
```

The directory and file should now exist.

#### Task 2: Run Heimdall as a container

1. On the Workstation, enter the following commands in a terminal session to create

```
sudo docker run -p 80:80 -v /docker/heimdall:/config -e  
TZ=Europe/London smt.example.com:5000/heimdall
```

This tells docker to run the heimdall container with the following options:

**Map port 80 in the container to 80 on the host**

**mount ~/docker/heimdall in the container in /config**

**Set the timezone within the container**

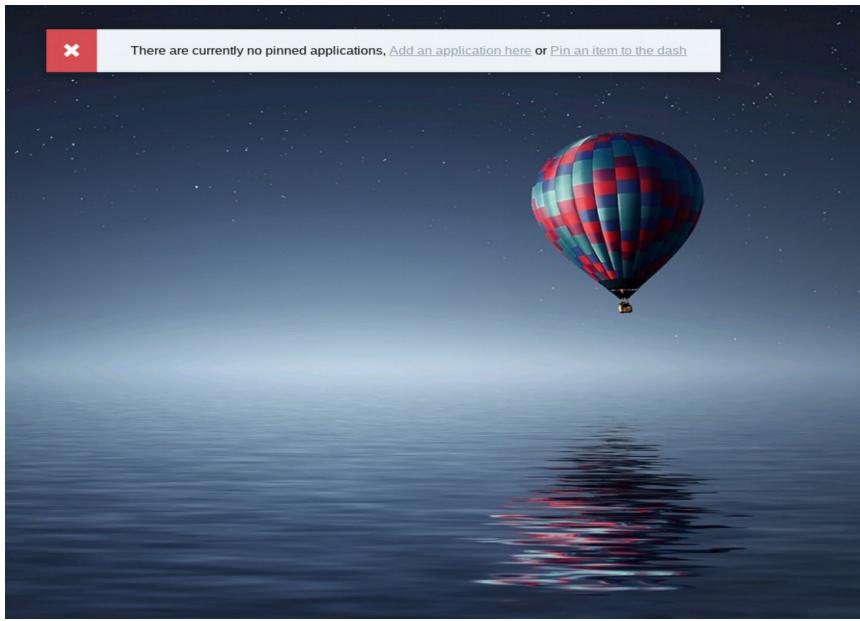

2. Notice that the first time it runs it created a default installation

## **Task 3:On the Workstation launch the Chrome Browser**

- ## 1. I On the Workstation launch the Chrome Browser

<http://127.0.0.1>

2. You should see a default screen with no Apps Defined

## Task 4: Create an App in Helm

1. Click on 'Add an application here'

**Application Name:** SUSE

**URL:** <http://www.suse.com>

**Select:** Pinned

Add application

PINNED    SAVE    CANCEL

Application name *	Application Type *	Colour *
SUSE	None	Hex colour
URL	Tags (Optional)	
<a href="http://www.suse.com">http://www.suse.com</a>		 Upload a file
Preview		
 		
		SAVE    CANCEL

2. Click Save to Save the App

## Task 5: Stop and restart container

1. On the Workstation, go back to the terminal session running the container and press the following Keys to stop the container instance

**<ctrl>C**

This will terminate the container instance

2. Restart the Docker Container

```
sudo docker run -p 80:80 -v ~/docker/heimdall:/config -e  
TZ=Europe/London smt.example.com:5000/heimdall
```

Notice How it start also immediately because it's using the configuration from the last time we launched the Application

## Task 6: Verify with Browser

1. On the Workstation launch the Chrome Browser

<http://12.0.0.1>

2. You should see the App you previously defined

## Task 7: Stop Container Instance

1. On the Workstation, go back to the terminal session running the container and press the following Keys to stop the container instance

**<ctrl>C**

This will terminate the container instance

## Task 8: Try and run multiple versions of Heimdall

1. On the Workstation, go back to the terminal session running the container and press the following Keys to stop the container instance

```
sudo docker run -d -p 80:80 -v ~/docker/heimdall:/config -e  
TZ=Europe/London smt.example.com:5000/heimdall
```

**\* notice we added the -d command to tell docker to run as a Daemon rather than in the foreground**

1. Try and run a second instance of the Heimdall

```
sudo docker run -d -p 80:80 -v ~/docker/heimdall:/config -e TZ=Europe/London smt.example.com:5000/heimdall
```

**Notice is fails because the port is already in use**

---

#### **Summary:**

In this exercise, you launched a container from the command line to see how it behaved

(End of Exercise)

---

## **6- 2 Launch Heimdall**

---

#### **Description:**

In this exercise, we will Heimdall without dedicated storage

---

### **Task 1: Create the Manifest for the Persistent Volume**

1. On the Workstation, in the text editor of your choice, open the file:

```
~/STW-CaaSPv4/labs/heimdall/app-health/heimdall-deployment_ns.yaml
```

Enter the following in the file:

## SUSE U Advanced - SUSE CaaS Platform

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: heimdall-shared-deployment
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: heimdall-shared
    spec:
      containers:
        - name: heimdall-pod
          image: linuxserver/heimdall
          ports:
            - containerPort: 80
```

2. On the Workstation, in the text editor of your choice, open the file:

**`~/STW-CaaSPv4/labs/heimdall/app-health/heimdall-service.yaml`**

Enter the following in the file:

```
apiVersion: v1
kind: Service
metadata:
  name: heimdall-shared-service
spec:
  type: NodePort
  ports:
    - port: 80
      nodePort: 33000
  selector:
    app: heimdall-shared
```

## Task 2: Deploy Heimdall

1. From a Terminal prompt on the Management workstation

**`kubectl apply -f ~/STW-CaaSPv4/labs/heimdall/app-health/heimdall-deployment_ns.yaml`**

**`kubectl apply -f ~/STW-CaaSPv4/labs/heimdall/app-health/heimdall-service.yaml`**

## Task 3: View the Deployment

- From Kubernetes Dashboard select Pods and then click on the Pod that was just deployed
- Click on the Log button so we can see what is happening on that Pod

The screenshot shows the Kubernetes Dashboard interface. The top navigation bar has a tab labeled 'heimdall-shared-deployment' with a red 'x'. Below it, the URL is 'localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/#/pod/default/heimdall-shared-deployment-c8df77bf4-jz2s2'. The main header says 'kubernetes' with a search bar and a 'CREATE' button. Below the header, the breadcrumb navigation shows 'Workloads > Pods > heimdall-shared-deployment-c8df77bf4-jz2s2'. On the right, there are four buttons: 'EXEC', 'LOGS' (which is highlighted with a red box), 'EDIT', and 'DELETE'. The left sidebar has sections for Cluster, Namespaces, Nodes, Persistent Volumes, Roles, Storage Classes, and Network. Under 'Namespaces', 'default' is selected. The main content area is titled 'Details' and shows the following pod information:

Name:	heimdall-shared-deployment-c8df77bf4-jz2s2
Namespace:	default
Labels:	app: heimdall-shared, pod-template-hash: 748933690
Annotations:	container.apparmor.security.beta.kubernetes.io/heimdall-pod: runtime/default, kubernetes.io/psp: suse.caasp.psp.unprivileged, seccomp.security.alpha.kubernetes.io/pod: docker/default
Creation Time:	2019-06-05T06:56 UTC
Status:	Running
QoS Class:	BestEffort

- Look at the logs and notice how it is creating a new installation

The screenshot shows the 'Logs' section of the Kubernetes Dashboard. The top navigation bar has a tab labeled 'Logs' with a red 'x'. Below it, the URL is 'localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/#/log/heimdall-shared-deployment-c8df77bf4-jz2s2'. The main header says 'kubernetes' with a search bar and a 'CREATE' button. Below the header, the breadcrumb navigation shows 'Logs'. The left sidebar has sections for Cluster, Namespaces, Nodes, Persistent Volumes, Roles, Storage Classes, and Network. Under 'Namespaces', 'default' is selected. The main content area shows the log output from the 'heimdall-pod' in the 'heimdall-shared-deployment-c8df77bf4-jz2s2' deployment. The logs include:

```

Logs from heimdall-pod in heimdall-shared-deployment-c8df77bf4-jz2s2

SUSE U Advanced - SUSE CaaS Platform

4. Let that deployment continue to run until it is completely finished (Refresh the Browser to check Status)

## Task 4: View Heimdall in a Browser

1. On the **Workstation** open the **Chrome browser** and go to  
**worker.example.com:33000**
  
2. Notice how ever time it is deployed it has to rebuild the installation
  
3. Stop the deployment by either killing it on the Kubernetes Dashboard from the command line by typing in the following command

**kubectl delete -f ~/STW-CaaSPv4/labs/heimdall/app-health/heimdall-deployment\_ns.yaml**

## Task 4: Re-deploy Heimdall

1. Repeat all of the steps in **Task 2 and Task 3**
2. Notice how ever time it is deployed it has to rebuild the installation

---

### Summary:

In this exercise, you created manifests for a Heimdall. We then deployed it and watched it build the default configuration. We learned that every time we deployed the app it had to create the default installation.

(End of Exercise)

---

## 6- 3 Configure Heimdall to use NFS Persistent Storage

---

### Description:

In this exercise, you configure a persistent volume on an NFS server. You then launch a pod that uses the persistent volume

---

## Task 1: Create the Manifest for the Persistent Volume

1. On the **Workstation**, in the text editor of your choice, open the file:  
**~/STW-CaaSPv4/labs/heimdall/app-shared/heimdall-pv-shared.yaml**

Enter the following in the file:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: heimdall-shared
spec:
  capacity:
    storage: 200Mi
  accessModes:
    - ReadWriteMany
  nfs:
    server: 192.168.110.2
    path: "/export/heimdall-shared"
```

## Task 2: Create the Manifest for the Persistent Volume Claim

1. In the text editor of your choice, open the file:

**~/STW-CaaSPv4/labs/heimdall/app-shared/heimdall-pvc-shared.yaml**

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: heimdall-shared-claim
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 200Mi
```

## Task 3: Create the Manifest for the Service so we can access the deployment

1. In the text editor of your choice, open the file:
2. **~/STW-CaaSPv4/labs/heimdall/app-shared/heimdall-service.yaml**

```
apiVersion: v1
kind: Service
metadata:
  name: heimdall-shared-service
spec:
  type: NodePort
  ports:
    - port: 80
      nodePort: 30000
  selector:
    app: heimdall-shared
```

#### Task 4: Create the Manifests for the Web Frontend

1. In the text editor of your choice, create/open the file:
2. **~/STW-CaaSPv4/labs/heimdall/app-shared/heimdall-deployment.yaml**

```

apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: heimdall-shared-deployment
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: heimdall-shared
    spec:
      containers:
        - name: heimdall-pod
          image: linuxserver/heimdall
          volumeMounts:
            - name: heimdall-pvc-shared
              mountPath: "/config"
      volumes:
        - name: heimdall-pvc-shared
          persistentVolumeClaim:
            claimName: heimdall-shared-claim

```

## Task 5: Deploy the Objects

1. To deploy the volumes/pods/service, open a terminal and enter the following command:

**kubectl apply -f ~/STW-CaaSPv4/labs/heimdall/app-shared**

You should see the following were created (not necessarily in this order):

deployment.extensions "heimdall-shared-deployment" created  
 persistentvolume "heimdall-shared" created  
 persistentvolumeclaim "heimdall-shared-claim" created  
 service "heimdall-shared-service" created

2. Enter the following command to view the deployments:

**kubectl get deployments**

You should see the **heimdall-shared-deployment** deployments listed.

3. Enter the following command to view the persistent volumes:

**kubectl get pv**

You should see the persistent volume **heimdall-shared** listed.

4. Enter the following command to view the persistent volumes:

**kubectl get pvc**

You should see the persistent volume claim **heimdall-shared-claim** listed.

## Task 6: Test the Persistent Data

1. On the **management workstation**, open a web browser and point to:

**http://worker10.example.com:30000**

Notice we have a Heimdall session pre-populated with 2 Applications

## Task 7: Remove the Objects from the Cluster

1. In the first terminal, enter the following commands to delete all of the objects:

**kubectl delete -f ~/STW-CaaSPv4/labs/heimdall/app-shared**

You should see that the objects were deleted.

---

### Summary:

In this exercise, you created manifests for a persistent volume, a persistent volume claim, a pod to that attached to the volume and writes data to an index.html file in the volume, and a web server that attaches to the volume and displays the index.html file. You then verified that the index.html file was being updated by looking at the file both on the NFS volume and the web server.

(End of Exercise)
